

## **The renewed Container Support**

**The most important changes and benefits of the redesign, clearly displayed for you**

**In this document, you will find an explanation of the redesign of the Container Support. A design that will lead to improvements in realization and transport.**

**The redesign ensures that both you, our NEDCON partner, and NEDCON itself, can reap the benefits.**

The Container Support has been redesigned by NEDCON. The biggest difference between the previous and current design is the composition. The former design of the Container Support consisted of parts that were welded together. The current design consists of edged sheet material. The advantage of this is that it takes up less space during transport, which in turn can indirectly lead to lower transport costs.

The Container Support is intended for steel containers in a manual pallet racking system. The maximum load is 1200KG.

**The Container Support comes in two different versions:**

- Frame depth 1100mm, depth of container 1200mm and width of container 800mm.

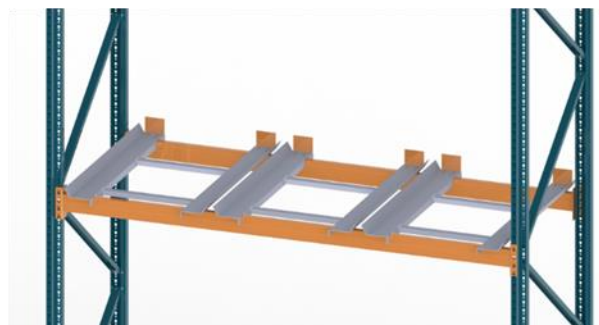

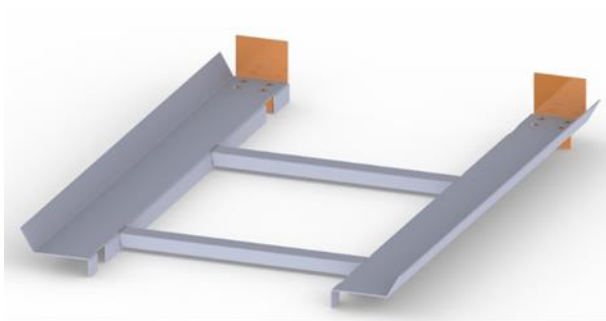

*(55408 Set Container Support FD1100)*

*(55409 Set Container Support FD1100 incl.backstop)*

- Frame depth 800mm, depth of container 800mm and width of container 1200mm.

*(55410 Set Container Support FD0800)*

*(55411 Set Container Support FD0800 incl.backstop)*

**Here is an overview of the advantages of the redesigned Container Support:**

- Solid construction
- To be mounted on 40mm and 50mm profile
- Easy to install by one person
- Smaller volume during transport so logistically more efficient
- Indirectly, the above points can lead to lower transport costs
